Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase

Example 4; Page 50; 56pp; English.

small peptide complexes and recombinat proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum C2 + Arbase (SERCA2A) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractility). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the cargo peptide from human PLB aminot terminal residues 1-16. It could be derived from any segment of wild type or mutant PLB protein. The cargo peptide is linked to the transport peptide by a covalent linkage The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase. 

Example 5; Page 52; 56pp; English.

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum (as 4 + AFpase (SERCA2a) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargot peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractiin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the penetratin-based recombinant protein, attached to the 3' end of denatured human immunodeficiency virus (HIV), TAT protein. Penetratin is a class of peptides, with translocating properties having the ability to carry hydrophilic compounds across the plasma membrane

H, Hoshijima M, Meyer M; He Dillman W, Minamisawa S, Wang Y, Silverman GJ; 98US-0106718P. 99US-0145883P. 99WO-US025692. (REGC ) UNIV CALIFORNIA. Chien K, Scott C,

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase

WPI; 2000-365393/31

Example 5; Page 52; 56pp; English.

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPase (BERCA2a) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myccardial for the gysfunction. The present sequence is the penetratin-based recombinant peptide PLB-MT, comprising the amino terminal end of human PLB native protein, attached to the 5' end of the Drosophila antennapedia (ANT) cansport peptide. Penetratin is a class of peptides, with translocating processing and manner and mycrafile PLB-MT, can also not be protein, a class of peptides, with translocating a passed across the olasma membrane

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, 224 ArPase of the sarco/endoplasmic reticulum, appearing as ADB45167-ADE45173. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site comprises ATS-14; a hydrophobic moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, Lys-27 and/or the phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-32 and/or Phe-35. The compound is not 3-benzopyzan-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the compound is refected a phospholamban on cardiac SERCA-2. The present sequence is the effects of phospholamban on cardiac SERCA-2. The present sequence is the

New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATFase by deactivating phospholamban and stimulating Ca2+

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum C2 + ATPase (SERA2a) within cardiomyocytes. The peptide scomplex comprises of transport peptide like penetratin and cargo peptide complex comprises of transport peptide like penetratin and PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g., heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising a sense mutation Val49Ala. This mutant sequence when contractility than the wild type PLB sequence.
                                                                                                                                                                                                                                                     Phospholamban, PLB, human; sarcoplasmic reticulum Ca 2+ ATPase, SERCA2a, cardiant, cardiomycoyte, transport peptide, penetratin, cargo peptide, contractility, inhibitor, cardiac disease, treatment; heart failure; mycoardial dysfunction; mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 75; DB 3; Length 52; 100.0%; Pred. small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ Arrest (SERCA2a) within cattorn between PLB and sarcoplasmic reticulum Ca 2+ Arrestor (SERCA2a) within cattorn between PLB respected complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac confractility and reduces blood pressure. This method is useful for the dysfunction. The present amino acid sequence is the human PLB wild type protein, a potent inhibitor of SERCA2a acidivity. It primarily exists in a pentameric form. It is a mediator in the regulation of myocardial function by catecholamines through the cAMP cascade

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, Ca2+ ArPase of the sarco/endoplasmic reticulum) appearing as ADB45167-ADB45167-ADB45167. The compound has a structure containing three of the four of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises TYT-6. Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site comprises Arg-14; a hydrophobic moiety associating with an S3 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is not 3-berayl-27 and/or Leu-28; and a hydrophobic moiety associating with an S4 binding site of the phospholamban cytosolic domain when the compound is not 3-berayl-57-bis ([H-tetrazol-5-y1)-methyloxy)-4-methyl-2H-1-benzopyran-2-one Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the CA2 + -ATPase. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA_2. The present sequence is a
                                                                                                                                                                                                                                                         Mouse; SERCA_2; phospholamban; PLB;
Ca2+ ATPase of the sarco/endoplasmic reticulum; protein co-ordinate data;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pound, useful for relieving inhibitory effects of phospholamban on SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ovaska M, Tenhunen J, Vidgren J_j onen M, Tilgmann C, Lotta T, Kaivola J_j
                                                                                                                                                                                                                    Mouse SERCA_2 inhibitor phospholamban.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; SEQ ID NO 6; 65pp; English.

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 or the the specification). ABN15762 to ABN27552 encode the human ORFX proteins are useful for proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polymucleotide syndrome associated with ORFX-associated disorders. Associated on the careful of the following of the cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benjud undurs, kaloid, degenerative disorders haemorrhage, of treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benjud undurs, kaloid, degenerative disorders haemorrhage, transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, disorders mellitus, systemic storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also bone degenerative disorders, incisions, ulcers, for treating osteoprosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis,

Novel human polypeptides and polynuclectides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders.

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, 22.4 ATPage of the sarco/endoplasmic reticulum ) appearing as ADB45167-ADB4513. The compound has a tructure containing three of the four moietises; an electromegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electromegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound. the S2 binding site of the phospholamban cytosolic comain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, Lys-27 and/or Leu-28; and a hydrophobic moiety associating with an S4 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-21, 22 and/or Phospholamban, comprising administering the included are deactivating phospholamban, comprising administering the involvence is a compound is a useful for relieving the inhibitory effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rabbit; SERCA 2, phospholamban; PLB; Ca2+ Afpase o\(\bar{t}\) the sarco/endoplasmic reticulum; protein co-ordinate data; cardiant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, ADE45173. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an 81 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, Lys-27 and/or Leu-28; and a hydrophobic moiety associating with an S4 binding site of the phospholamban cytosolic domain associating with an S4 binding site of the phospholamban cytosolic domain
                                                                                                                                                                                                                                                                                                                                             Rat; SERCA_2; phospholamban; PLB;
Ca2+ ATPase of the sarco/endoplasmic reticulum; protein co-ordinate data;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      when the compound is bound, the binding site comprises Phe-32 and/or Phe-35. The compound is not 3-benzyl-5,7-bis (lH-tetrazol-5-yl)-methyloxy)-4-methyl.2H-lbenzopyran-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the Ca 2 + -APPase. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA_2. The present sequence is a

New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+ -ATPase.

WO200025804-A2

11-MAY-2000

Claim 1; SEQ ID NO 1; 65pp; English.

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA\_2, Ca2+ ATPEASIOF. The sarcof-endoplasmer reticulum?) appearing as ADE45167-ADE45173. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an SI binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyre, ATG-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic Arg-14; a hydrophobic moiety associating with an S3 binding site comprises phospholamban cytosolic domain when the compound to it, the S2 binding site comprises phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, Lys-27 and/or Leu-28; and a hydrophobic moiety 

associating with an S4 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-32 and/or Phe-35. The compound is not 3-benzyls.7-bis (IH-tetrazol-5-yl)-methyloxy)-4-methyl-2H-methyl-2H-1-benzopyran-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the Ca. 4-ATPRESE. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA\_2. The present sequence is Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant; cardiomyocyte; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; mutant; treatment; heart failure; myocardial dysfunction; recombinant protein; fruit fly; ANT; antennapedia; H6 tag; hexahistidine. /note= "Corresponds to mutant human phospholamban (PLB) H6 tagged penetratin-based recombinant protein, H6-(V49A)mutantPLB-ANT. triphosphatase

```
small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum (2 + Arpase (SERCA2a) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and carcop peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and mycoardial dysfunction. The present sequence is the hexahistidine (H6) tagged penetratin-based recombinant protein H6-mutantPLB-ANT, comprising the turnsport peptide attached by a hexahistidine tag. This sequence is expressed in Escherichia coli cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "Corresponds to Human phospholamban (PLB) protein"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a, cardiant; cardiomyocyte; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction; recombinant protein; fruit fly; ANT; antennapedia; H6 tag; hexahistidine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hexahistidine tagged penetratin-based recombinant protein, H6-wtPLB-ANT.
                  The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinate controls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        63. 78

small peptide complexes and recombinant protectins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ Arpase (SERCAZa) within cardiomyocytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as a dominant negative inhibitor of FLB-SERCAZa interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the hexahistidine (H6) tagged penetratin-based recombinant protein H6-wtPLB-ANT, comprising the wild type human PLB protein and brosophila antennapedia (ANT) transport Escherichia coli cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant; cardiomyocyte; transport peptide; penetratin; cargo peptide; contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction; mutant.
           Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine

Disclosure, Page 49, 56pp, English.

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (FLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum C2 + ArPase (SERCA2a) within cardiomycyptes. The peptide selected from mutant PLB, native FLB or antibody against PLB protein (contractilin). Penetratin-FLB peptide functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising the mutation Serl6Ann. This mutant sequence when overexpressed in the transformed cardiomycoytes, shows increased contractility than the wild type PLB sequence

New compound, useful for relieving inhibitory effects of phospholamban on cardiac SR Ca2+-ATPase by deactivating phospholamban and stimulating Ca2+

Claim 1; SEQ ID NO 2; 65pp; English.

-ATPase.

The invention relates to a compound which deactivates, and exhibits affinity for, a phospholamban (PLB) protein (an inhibitor of SERCA 2, Ca2+ ATPase of the sarco/endoplasmic reticulum ) appearing as ADE45167-

```
ADB45173. The compound has a structure containing three of the four moieties: an electronegative moiety associating with an S1 binding site of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr.6, Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is not 3-benzyl-5/-bis ([H+tetrazol-5-y]) methyloxy) 4 methyl-2H-methyl-2H-methyl-2H-methyloxyl-4-compound is not 3-benzyl-5/-bis ([H-tetrazol-5-y]) methyloxyl-4-compound is not 3-benzyl-sing the involed are deactivating the case the Ca 2 + -ATPase. molety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site comprises pag-14; a hydrophobic molety associating with an S3 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, Lys-27 and/or Leu-28; and a hydrophobic molety associating with an S4 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site of the phospholamban cytosolic domain when the compound is not 3-benzoyxan-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the Ca 2 + ATPsas. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA_2. The present sequence is a

mall peptide complexes and recombinant proteins, that induces phospholamban (FLB) deficiency and inhibits the interaction between PLB and sarcoplasmic retuciun (a 2 + ATPase (SERCA2A) within cardiomycytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide complex comprises of transport peptide like penetratin and protein (contractilin). Penetratin-PLB peptide like penetratin and of minant negative inhibitor of PLB-SERCA2 interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial contractility comprising the amino terminal end of human PLB mutant PLB, comprising the amino terminal end of human PLB mutant (Seriallu) protein, attached to the 3' end of denatured human communodeficiency virus (HIV), TAT protein. Penetratin is a class of phydrophilic compounds across the plasma membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cardiant; cardiomycyte; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility, inhibitor; cardiac disease; mutant; treatment; heart failure; myocardial dysfunction; recombinant protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a;
                                                                  The patent discloses a method for the treatment of heart failure, using

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ APPase (SERCAZa) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against Complex complex complex compressed in the peptide functions as a cominant negative inhibitor of PLB-SERCAZa interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the penetratin-based recombinant peptide, mutant PLB-ANT, comprising the amino terminal end of human PLB mutant (SeriGGlu) proteath, attached to the 5' end of the Drosophila antennapedia (ANT) transport peptide. Penetratin is a class of peptides, with translocating properties having the ability to carry hydrophilic compounds across the plasma membrane
                                                                Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; phospholamban; PLB; cardiant; heart disease; gene therapy;

                              Delivering a dose of a gene expression cassette in a fluid selectively to heart for sustained expression, useful for improving or enhancing cardiac function, by employing a viral vector together with a vascular
                                                                                                                                   The invention relates to delivering a therapeutic dose of a gene expression cassette in a fluid selectively to heart for sustained expression, comprising employing a viral vector together with a vascular permeabilising agent. The method is useful for gene therapy delivering genes for improving or enhancing cardiac function, particularly in passet of heart disease. The present sequence is that of a pseudophosphorylation mutant of phospholamban (SiGEPLB). This point mutant is among a number of dominant negative mutants identified and characterised in WO00/25804 and used in the method of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chicken; SERCA_2; phospholamban; PLB;

ö
of the phospholamban cytosolic domain when the compound is bound to it, the binding site comprises Tyr-6, Arg-9 and/or Arg-13; an electronegative moiety associating with an S2 binding site of the phospholamban cytosolic domain when the compound is bound to it, the S2 binding site comprises Arg-14; a hydrophobic moiety associating with an S3 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Met-20, Lys-27 and/or Leu-38; and a hydrophobic moiety associating with an S4 binding site of the phospholamban cytosolic domain when the compound is bound, the binding site comprises Phe-32 and/or Phe-35. The compound is not 3-benzopyran-2-one. Also included are deactivating phospholamban, comprising administering the novel compound to stimulate the Ca 2 + -ATPass. The compound is useful for relieving the inhibitory effects of phospholamban on cardiac SERCA_2. The present sequence is a

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ ATPsea (SERCA2A) within cardiomycytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PLB, native PLB or antibody against PLB protein (contractilin). Penetratin-PLB peptide functions as dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present sequence is the hexahistidine (HS) tagged penetratin-based recombinant protein H6-matantPLB-NNT, comprising the human mutant (SerlGGlu) PLB protein and Drosophila antennapedia (ANT) transport peptide attached by a hexahistidine tag. This sequence is expressed in Bscherichia coli cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Phospholamban; PLB; human; sarcoplasmic reticulum Ca 2+ ATPase; SERCA2a; cardiant; cardianyoxytre; transport peptide; penetratin; cargo peptide; contractilin; cardiac contractility; inhibitor; cardiac disease; treatment; heart failure; myocardial dysfunction; mutant.
                                                       Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

small peptide complexes and recombinant proteins, that induces thospholamban (PLB) deficiency and inhibits the interaction between PLB and sarcoplasmic reticulum Ca 2+ Arpase (SERCASa) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide complex comprises of transport peptide like penetratin and the preptide selected from mutant PLB, native PLB or antibody against dominant negative inhibitor of PLB-SERCASa interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising a sense mutanion Argiddlu. This mutant sequence when overexpressed in the transformed cardiomycoytes, shows increased contractility than the wild type PLB sequence Treating cardiac diseases, e.g. heart failure or myocardial dysfunction comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase. The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant controls. Disclosure; Page 48-49; 56pp; English.

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PIB) deficiency and inhibits the interaction between PIB and sarcoplasmic reticulum Ca 2+ ATPase (SBRCA2a) within cardiomycoytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutant PIB, native PIB or antibody against PIB protein (contractility). Penetratin-PIB peptide functions as a contractility and reduces blood pressure. This method is useful for the treatment of cardiac disease e.g. heart failure and myocardial dysfunction. The present amino acid sequence is the human mutant PIB protein, comprising the mutation Glu2Ala. This mutant sequence when overexpressed in the transformed cardiomycoytes, shows increased contractility than the wild type PIB sequence. se enhancing cardiac contractility by inhibiting interaction phospholamban and sarcoplasmic reticulum calcium 2+ adenosine English. 48; 56pp; Disclosure; Page triphosphatase small re comprises (

Treating cardiac diseases, e.g. heart failure or myocardial dysfunction

comprises enhancing cardiac contractility by inhibiting interaction between phospholamban and sarcoplasmic reticulum calcium 2+ adenosine triphosphatase.

Disclosure; Page 49; 56pp; English

The patent discloses a method for the treatment of heart failure, using small peptide complexes and recombinant proteins, that induces phospholamban (PLD) deficiency and inhibits the interaction between PLB carcophasmic reticulum Ca 2+ Arpase (SERCA2a) within cardiomyocytes. The peptide complex comprises of transport peptide like penetratin and cargo peptide selected from mutent PLB, native PLB or antibody against cargo peptide selected from mutent PLB pertiae functions as a dominant negative inhibitor of PLB-SERCA2a interaction, enhances cardiac contractility and reduces blood pressure. This method is useful for the contractility and reduces blood pressure. This method is useful for the dysfunction. The present amino acid sequence is the human mutant PLB protein, comprising the double mutantion Lyssilu and ArgisGlu. This mutant sequence, when overexpressed in the transformed cardiomycoytes, shows increased contractility than the wild type PLB sequence mutant cardiac

Novel antifungal protein FCWP1, isolated from Fusarium culmorum, useful for controlling fungal infections in plants. Example 21; SEQ ID NO 181; 27pp; English.

The invention relates to an isolated antifungal ribosomal protein from

cuerdul for controlling fungal infections in plants, such as the controlling fungal infections in plants, such as the controlling fungal infections in plants, such as the cockyta (e.g. Alcernaria brassicola, Alternaria cinerea), accoragora celegations at kinchii, cercospora zeae-maydis), cercospora zeae-maydis), cercospora zeae-maydis), collectrichum (e.g. Collectrichum lindemuthianum), Diplodia (e.g. Collectrichum (e.g. Fusarium nivale, Fusarium avysporum, planting paranium roseum), Rusarium culmorum, Fusarium solani, Fusarium compliceme, Fusarium carbonum, Helminthosporium maydis), Macrophomina cheminic paraniparium phaseolina, Meditia (e.g. Helminthosporium maydis), Macrophomina (e.g. Mycosphaerella figiensis), Nectria (Nectria Macrophomina (e.g. Mycosphaerella figiensis), Nectria (Nectria branatococca), Phoma betee ), Phyradetrichum (e.g. Phymatotrichum omnivorum), Phyrophthora (e.g. Phyrophthora cinnamoni, Phyrophthora capacina), Phyrophthora capacina, Phyrophthora and baseoli, Phyrophthora cinnamoni, Phyrophthora (e.g. Phyrophthora cinnamoni, Phyrophthora (e.g. Phyrophthora cinnamoni, Phyrophthora (e.g. Phyrophthora cinnamoni, Phyrophthora (e.g. Phyrophthora cinnamoni, Phyrophthora (e.g. Phyrophthora cinnamoni, Phyrophthora (e.g. Phyrophthora cinnamoni, Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrophthora (e.g. Phyrop signal peptide of the antifungal protein AlyAFP from Alyssum and FCWP1, encoded by the nucleic acid appearing as ADC87758. The FCWP1 proteins are useful for controlling fungal infections in plants, such as those caused antifungal proteins. The present sequence represents one of the riboson proteins similar to FCWP1. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in fusarium culmorum, FCWP1. Also included is a fusion protein between electronic format directly from USPTO at segdata.uspto.gov/sequence.html?DocID=6573361B1

Patent No. 5891717
GENERAL INFORMATION:
APPLICANT: Christopher B. Newgard, et al.
TITLE OF INVENTION: Methods and Compositions for
TITLE OF INVENTION: Inhibiting Hexokinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    COMUTER: IBM PC compatible

C; Comment: Phospholamban is expressed in cardiac muscle, slow twitch skeletal muscle, and C; Comment: Phospholamban is the major phosphorylated protein in cardiac muscle sarcoplast C; Comment: Phospholamban is the major phosphorylated and the rate of muscle relaxation is c; Genetics:
A; Note: only one gene was detected
A; Note: only one gene was detected
A; Note: only phospholamban
C; Genetics:
A; Note: only phospholamban
C; Keywords: accrylated amino end; ATPase inhibitor; muscle; pentamer; phosphorotein; tr
C; Keywords: accrylated amino end (Met) #status predicted
F; 11/Modified site: accrylated amino end (Met) #status predicted
F; 11/Binding site: phosphate (Gar) (covalent) (by caMP-dependent kinase) #status F; 11/Binding site: phosphate (Thr) (covalent) (by calmodulin-dependent Kinase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  phospho-sugar mutase PAB1666 - Pyrococcus abyssi (strain Orsay)
C.Species: Pyrococcus abyssi
C.Species: 20-Aug-1999 #sequence_revision 20-Aug-1999 #text_change 20-Jun-2000
C.Accession: F75089

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 13
D69155
hypothetical protein MTH425 - Methanobacterium thermoautotrophicum (strain Delta H)
C;Species: Methanobacterium thermoautotrophicum
C;Decies: Methanobacterium thermoautotrophicum
C;Decies: Methanobacterium thermoautotrophicum
C;Date: 05-Dec-1997
